

## CLAIMS

What is claimed is:

5 1. For holding at least one item:

at least a first planar member having a first surface and  
a second surface opposing one another;

at least one raised portion in perpendicular contact with  
at least a surface of said at least a first planar member;

10 means for maintaining at least one substantially planar display item  
in contact with said at least a first planar member.

2. The device and system of claim 1, wherein:

said at least a first planar member is of plastic;

15 said at least one raised portion is of plastic;

said means for maintaining at least one raised portion

in perpendicular contact with at least a surface of

said at least a first planar member is integral molding;

said means for maintaining at least one substantially planar display item

20 in contact with said at least a first planar member is  
a glue-like element.

3. The device and system of claim 2, wherein:

said at least one raised portion is integrally molded with

25 at least one surface of said at least a first planar member;

4. The device and system of claim 3, wherein:

said means for maintaining at least one raised portion

in perpendicular contact with at least a surface of

30 said at least a first planar member is sonic welding;

5. The device and system of claim 4, wherein:

said at least a first planar member is of metal;

said at least one raised portion is of metal;

said means for maintaining at least one raised portion

in perpendicular contact with at least a surface of

said at least a first planar member is integral molding;

6. For holding at least one item:

at least a first planar member having a first surface and

a second surface opposing one another;

at least a second planar member having a first surface and

a second surface opposing one another;

at least one raised portion in perpendicular contact with

at least a surface of said at least a first planar member;

means for maintaining at least one substantially planar display item

in contact with said at least a first planar member.

7. The device and system of claim 6, wherein:

said at least a first planar member is of plastic;

said at least a second planar member is of plastic;

8. The device and system of claim 7, wherein:

said at least one raised portion in perpendicular contact with

at least a surface of said at least a first planar member

is integrally molded of plastic;

means for maintaining at least one substantially planar display item

in contact with said at least a first planar member is tension

created in a defined cavity formed between said at least a first

planar member and said at least a second planar member suitable

for receiving the introduction of at least one substantially planar

display item.

9. The device and system of claim 9, wherein:

said at least a first planar member is of translucent plastic;

said at least one raised portion is of translucent plastic;

5       said at least a second planar member is of translucent plastic;

10. The device and system of claim 9, wherein:

at least a surface of said at least a first planar member is textured

to enhance friction imparted to said at least one substantially

10       planar display item.

11. For holding at least one item:

at least a first planar member having a first surface and

a second surface opposing one another;

15       at least a second planar member having a first surface and

a second surface opposing one another;

means for maintaining at least a portion of said at least a first planar member

and said at least a second planar member in contact with each other

so that a pressure tension is created in a defined cavity formed between

20       said at least a first planar member and said at least a second planar member

and suitable for receiving the introduction of at least one substantially planar

display item.
